

XENO-URBAN ARCHITECTS

COMPANY PROFILE

ABOUT

Xeno-Urban Architects is a SACAP registered architecture firm with the highest category of professional registration. We are based out of George, WC, but we are set up to work remotely all over Southern Africa and by using an innovative and flexible corporate structure, we are able to assemble teams of various sizes to ensure the right level of manpower, skill and individual attention for the success of any project.

With over a decade of collective experience in large and small scale residential, corporate, commercial and hospitality projects, we know how to imbue our projects with the perfect mix of quality, innovation, sustainability and green features. We also engage in joint ventures, partnerships and project initiation and are willing to negotiate innovative fee and service structures to suit unique project conditions.

TEAM STRUCTURE

XUA was started by Ruan Bosman, a SACAP registered professional architect with a passion both for contemporary design and the transformative power of human ingenuity. Ruan has a Master of Architecture and an Honour's degree from the University of the Witwatersrand as well as a Bachelor of Sciences in Architecture from the University of Pretoria. He has worked as a professional in the industry since 2013, gaining valuable experience on projects ranging from small residential additions to large multi-billion rand mixed-use developments.

XUA functions as a collaborative network of architectural professionals. As such, Ruan actively leads a flexible team of architectural professionals who use remote working technologies to co-operate on and complete projects all over the country. Using this network, we are able to expand and customise project teams to include all the man-power and skills necessary to deliver the highest quality service on any given project, all while ensuring every project is personally overseen by a registered professional architect with the highest possible qualification.

OUR WHY

We help discerning property investors create spaces that accommodate healthy, sustainable lifestyles that maintain a connection to nature. Our unique brand of Eco-Architecture aims to replace typical claustrophobic and unhealthy buildings with beautiful spaces that look and feel in harmony with the natural environment.

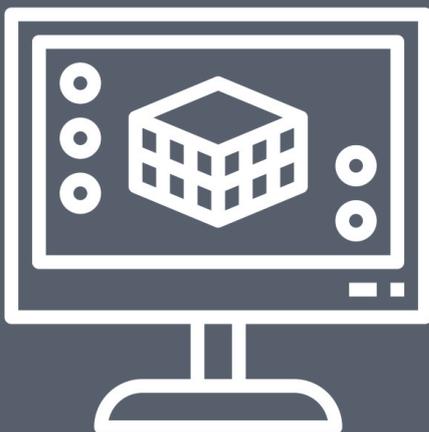

This type of architecture can boost investment value for owners, improve profitability for developers and create safe, comfortable spaces that improve quality of life for inhabitants. It can solve seemingly insurmountable problems in unexpected ways and forever change the way we interact with our man-made as well as our natural environment.

TECHNOLOGIES

We use the latest technologies to allow us to run a 'virtual' office which lets us work effectively regardless of where in the world our client, our site or our team members happen to be located on any given project. Our files are safely located on the cloud, making them accessible to anyone who we give permission to, but simultaneously protected from theft or loss by some of the most advanced measures the world has to offer. Online meeting and project management tools are used to track project progress and to keep our team members connected and informed at all times.

We also use the latest and best software in our design work to create a detailed virtual building to be experienced in realistic 3D before a single brick is laid. This helps professional consultants, clients and builders to communicate clearly and minimises misunderstandings which so often cause countless problems on construction projects. Realistic renders and animations are included by default in all our packages to give clients a better understanding of our designs and provide developers with great marketing material.
